

Toronto Functional Medicine Centre Publishes Educational Guide on NAD Cellular Support for Age-Related Visual Health

June 17, 2026

TORONTO, ON - June 17, 2026 -

Toronto Functional Medicine Centre has released a new educational guide examining the role of Nicotinamide Adenine Dinucleotide (NAD) in supporting age-related visual health. The resource, published on the Centre's website, explores how functional medicine approaches and NAD IV therapy in Toronto may address cellular changes linked to waning vision.

The guide outlines the scientific connection between declining NAD⁺ levels and common age-related eye health concerns, including age-related macular degeneration (AMD), glaucoma, and general eye fatigue. Citing clinical insights from peer-reviewed literature, the publication notes that visual conditions are frequently tied to localized inflammation, diminished mitochondrial function, and decreased cellular repair capabilities.

NAD, a critical coenzyme found in all human cells, plays a fundamental role in metabolic processes, DNA repair, and energy production. Because the retina is one of the most metabolically active tissues in the body,

it exhibits high energy demands that rely on robust mitochondrial activity. The Centre's educational resource explains that as natural NAD⁺ levels decline with age, stress, and environmental exposures, cellular energy within retinal tissues may become compromised, potentially impacting visual acuity over time.

The publication explores various methods for supporting the body's coenzyme levels, highlighting the practical differences between oral supplementation and intravenous administration. The guide explains that utilizing NAD IV therapy in Toronto bypasses the digestive tract entirely, allowing for optimal cellular absorption of the coenzyme to support systemic cellular energy production.

The exploration of coenzyme optimization follows the Centre's previous educational release, which examined how supportive wellness technologies, such as Red Light and Pulsed Electromagnetic Field (PEMF) applications, may be utilized alongside NAD IV therapy. That publication outlined how multi-modality approaches may be structured within an integrative plan to address age-related cellular declines and support mitochondrial function. By continuing to publish detailed guides on cellular cofactors, the clinic aims to provide comprehensive informational resources for individuals seeking an individualized approach to healthy aging.

In alignment with an integrative approach to wellness, the resource also reviews complementary lifestyle factors and supportive nutrient strategies that may promote overall eye vitality. These include the strategic use of antioxidant therapies to manage oxidative stress, alongside adjustments to diet and environmental toxic loads that influence metabolic health.

The Centre's healthcare team, composed of a naturopathic doctor and nurse practitioner, conducts thorough baseline health assessments before any treatment plan is implemented. This individualized evaluation helps determine specific nutritional needs, assess lifestyle variables, and monitor patient responses during intravenous applications.

Located in the Yorkville neighborhood of Toronto, Ontario, the Toronto Functional Medicine Centre offers integrative and individualistic healthcare services. The clinic's multidisciplinary team combines naturopathic medicine, acupuncture, bio-identical hormone replacement therapy, and detoxification programs to investigate the underlying root causes of chronic health issues. Through comprehensive testing and custom therapeutic strategies, the clinic strives to support balanced, long-term wellness for patients across the Greater Toronto Area.

For further details regarding the newly published guide or the clinic's services, please visit the Toronto Functional Medicine Centre website, or contact their team directly via phone at (416) 968-6961 or by email at
